# 1. Abstract

This report examines Teddykompaniet's international expansion potential and identifies the most suitable market, entry mode, and strategic approach. A structured comparative analysis was conducted across France, Italy, Spain, and Portugal using six key dimensions: market demand, market size, market growth, purchasing power, market conditions, and business environment. The Analytic Hierarchy Process (AHP) was applied to weight variables and ensure a consistent evaluation.
The results show that France is the most attractive market, primarily due to its large market size, strong purchasing power, and favorable overall market conditions.

Based on these findings, a distributor-based entry mode is recommended as the most suitable strategy, allowing Teddykompaniet to balance control, risk, and resource commitment. The analysis further highlights that success in the French market depends on careful distributor selection, alignment with premium retail channels, and consistent brand positioning.

Overall, the report concludes that Teddykompaniet should pursue a gradual expansion strategy, entering France through a premium-oriented distributor and selectively expanding distribution over time to ensure sustainable international growth.

# 2. Company Prerequisites

## 2.1 Strengths

First, the company benefits from a strong brand identity built around safety, quality, and emotional value. According to the Resource-Based View (RBV), competitive advantage arises when firms possess valuable and difficult-to-imitate resources (Barney, 1991). Teddykompaniet's brand positioning reflects such an intangible resource. The company's focus on emotional attachment and long-term product value differentiates it from low-cost toy manufacturers and highly commercialized licensed toy brands.

The VRIO framework (Barney, 1991) further suggests that this positioning has the characteristics required for sustainable advantage. The brand is valuable because it aligns with consumer demand for safe and trustworthy children's products. It is relatively rare within the toy industry, where many competitors compete primarily through price or licensed entertainment brands. It is also difficult to imitate, since brand credibility and reputation develop over time and are shaped by organizational culture and history.

Furthermore, Teddykompaniet benefits from a transferable value proposition. The core drivers behind the company's value proposition are emotional attachment, gift-giving traditions, and safety, which are not unique to the Swedish market. These purchasing motivations exist across most developed consumer markets. From an internationalization perspective, this reduces the need for any major product redesign when entering new markets.

The company operates with an asset-light production structure in which manufacturing is coordinated through external production partners. From a value chain perspective (Porter, 1985), this configuration allows production volumes to scale without large capital investments in manufacturing infrastructure. Such flexibility supports international expansion because increased demand from foreign markets can be accommodated without major structural changes to production capacity.

Finally, Teddykompaniet has already developed experience in relationship-based distribution through retailers and distributors. According to network theory and the revised Uppsala model, international expansion often occurs through the gradual development of relationships with foreign partners (Johanson & Vahlne, 2009). The company's existing experience in managing retailer and distributor relationships therefore represents a transferable capability that may support expansion into new markets.

In conclusion, these factors indicate that Teddykompaniet possesses several firm-specific advantages that can potentially support international growth.

## 2.2 Weaknesses

Despite these strengths, the analysis also identifies several internal limitations that may influence the pace and structure of international expansion.

A key constraint relates to the company's centralized logistics structure. All distribution is currently handled through a single warehouse in Sweden. While this configuration facilitates strong operational control and efficient inventory management within a geographically concentrated market, it introduces logistical complexity as the firm expands into more distant markets. From a value chain perspective, outbound logistics become increasingly important when firms operate in multiple markets simultaneously (Porter, 1985). Distribution from a single inventory hub may lead to longer transportation distances, greater delivery variability, and increased reliance on cross-border logistics networks. As the number of markets increases, the risk of supply disruptions, lead times, or service delays also grows.

A further limitation relates to organizational capacity. Teddykompaniet operates with a relatively lean organizational structure. While this supports efficiency and flexibility in the domestic market, managing multiple markets typically requires additional coordination across logistics, distributors, marketing activities, and supply chain planning.

The Uppsala model of internationalization suggests that firms expand gradually as they accumulate experiential knowledge of foreign markets (Johanson & Vahlne, 2009). Because Teddykompaniet has primarily operated within a geographically and culturally close environment, its experience managing diverse international markets remains limited.

Finally, the company's dependence on external distributors and retailers for market access represents both a strength and a vulnerability. While distributor-based entry reduces capital requirements, it also means that market success depends heavily on the quality and commitment of external partners. Poor partner selection or misalignment in brand positioning could weaken the company's competitive differentiation.

These limitations do not prevent international expansion but suggest that expansion should be approached gradually and with careful partner selection.

## 2.3 Opportunities

In addition to internal strengths, several external opportunities support Teddykompaniet's international growth ambitions.

The targeted Southern European markets represent a significantly larger consumer base than the Nordic region where the company currently operates. France (67 million inhabitants), Italy (59 million), Spain (48 million), and Portugal (10 million) together represent a combined population of approximately 185 million consumers (World Bank, 2024b). This is substantially larger than the Nordic region and therefore offers considerable growth potential. From a demographic perspective, the combined child population (ages 0–14) in these four markets exceeds 25 million, with France alone having a larger child population than the Nordic countries combined (World Bank, 2024b). For a company operating in the children's product segment, this demographic structure represents a significant expansion opportunity.

Furthermore, the company may benefit from the positive international reputation associated with Swedish products and Scandinavian design. According to the Swedish Institute's Brand Sweden Report (2025), Sweden is consistently associated globally with innovation, quality, sustainability, and responsible production. These perceptions contribute to a positive country-of-origin effect, which can strengthen consumer trust in Swedish products abroad. For Teddykompaniet, whose brand emphasizes safety, quality, and emotional value, the association with Swedish origin may reinforce the credibility of the brand in foreign markets.

Finally, the company has the opportunity to expand its international distributor network, which remains the primary mechanism through which the company enters new markets.

## 2.4 Threats

Despite these opportunities, international expansion also exposes the company to several external risks.

The toy industry is characterized by intense competition from both global and local brands. Large international companies benefit from strong brand recognition, extensive distribution networks, and significant marketing resources. At the same time, local niche brands may possess strong relationships with domestic retailers.

In addition, the company's dependence on external manufacturing partners introduces potential supply chain risks. Production disruptions, quality issues, or geopolitical factors affecting manufacturing locations could influence supply reliability.

Retail market dynamics also present potential challenges. Many retail sectors are experiencing consolidation, which may reduce shelf space for smaller brands and increase the bargaining power of large retail chains.

Finally, international expansion inevitably involves the liability of foreignness (Zaheer, 1995). Firms entering new markets must compete against established players while simultaneously adapting to unfamiliar institutional environments, consumer preferences, and distribution systems.

## 2.5 Overall Assessment

The analysis indicates that Teddykompaniet possesses several prerequisites for international expansion. The company benefits from a distinctive brand identity, transferable product positioning, and a flexible production structure that can support increased output. These characteristics represent important firm-specific advantages that can potentially be leveraged in foreign markets.

At the same time, the company's current configuration reflects an organization optimized primarily for a geographically concentrated market. Centralized logistics, reliance on external distributors, and a lean organizational structure suggest that expansion should be approached carefully.

Overall, Teddykompaniet appears well positioned for gradual international expansion, particularly through distributor-based entry into carefully selected markets. Future success will depend not only on market attractiveness but also on the company's ability to build strong international partner networks and manage increasing coordination complexity.

The following chapter therefore evaluates potential target markets to identify the most suitable country for Teddykompaniet's next stage of international growth.

# 3. Market Analysis and Selection

## 3.1. Analytical approach

To identify the most attractive foreign market for Teddykompaniet, a structured market assessment model was developed. The analysis compares potential target markets using a set of variables that capture both market attractiveness and the potential competitive position of the firm. The aim is to systematically evaluate which country offers the strongest conditions for market entry and long-term growth.

Six groups of variables were selected based on their relevance to the toy and stuffed animal industry:

1. Market demand
2. Market size
3. Market growth
4. Purchasing power
5. Market Conditions

6. Business Environment and entry feasibility

These categories combine demographic indicators, economic indicators, consumer spending behavior, and market structure factors. Together they provide a comprehensive evaluation of both current market potential and future growth opportunities.

To ensure transparency and consistency in the evaluation, the variables were analyzed using the Analytic Hierarchy Process (AHP) (Saaty, 1980). This method allows different variables to be weighted according to their relative importance while maintaining a systematic comparison between markets. Pairwise comparisons were used to determine weights for both individual variables and broader evaluation categories. The selection of variables is also consistent with established business frameworks. Demographic, economic, and industry indicators give insight into macro-environmental conditions typically analyzed through PESTEL frameworks (Aguilar, 1967), while variables like market accessibility, competition, and institutional conditions relate to the institutional dimensions of the CAGE framework (Ghemawat, 2001). In addition, the focus on geographically and culturally closer European markets is consistent with the Uppsala model (Johanson & Vahlne, 1977), which suggests that firms often expand globally into markets with lower psychic distance.

All quantitative indicators were normalized to ensure comparability across countries. The final market score for each country was calculated as a weighted aggregation of the category scores.

The countries included in the analysis are:

- France
- Italy
- Spain
- Portugal

The countries included in the comparative analysis are France, Italy, Spain, and Portugal, as these represent the potential target markets assigned for the evaluation.

Sweden was used as a benchmark because it represents the firm's home market, providing a useful reference point for understanding consumer spending patterns and market characteristics in a market where the company is already established.

Detailed normalization results and AHP weighting matrices are provided in Appendix 1.

## 3.2. Market Assessment Variables

### 3.2.1 Market Demand

Market demand is a key determinant of the potential customer base for Teddykompaniet's products. Since the company primarily targets children and families, demographic indicators related to the child population were used.

The analysis includes:

- Population aged under 14
- Population aged under 18
- Projected child population for 2030
- Projected child population for 2040
- Historical and forecasted birth rates

These variables capture both the current size of the target market and the future development of demand. These demographic indicators reflect key macro-environmental conditions that influence market attractiveness, consistent with PESTEL-based analysis of population dynamics and long-term demand drivers (Aguilar, 1967).

Markets with a larger and more stable child population are more attractive because they provide a sustained consumer base for toys and stuffed animals.

*Table 1*

| Population | Children under 18 | Children under 14 | Children under 18 (2030) | Children under 14 (2040) | Children under 14 (2040)2 | Children under 14 2030* |
|---|---|---|---|---|---|---|
| **Sweden** | **2,189,740** | **1780800** | **2,080,000** | **1565000** | **1930000** | **1686370** |
| **France** | **13,624,729** | **11387600** | **12810000** | **9900000** | **11850000** | **11028682** |
| **Italy** | **7,881,820** | **6321000** | **7090000** | **5060000** | **6305000** | **6244433** |
| **Portugal** | **1,653,031** | **1310400** | **1470000** | **1035000** | **1305000** | **1339661** |
| **Spain** | **8,955,209** | **6490000** | **8150000** | **5320000** | **7340000** | **5867014** |

The demographic indicators presented in Table 1 provide an overview of both the current and projected size of the child population in the analyzed markets. France has the largest potential consumer base, with more than 13.6 million children under the age of 18 and over 11.3 million under the age of 14. Spain and Italy also represent substantial markets in terms of child population, while Portugal is considerably smaller. Since Teddykompaniet primarily targets young children and families, the size of these age groups provides a strong indication of the potential demand for stuffed toys.

The table also includes projections of the child population in 2030 and 2040 in order to capture the expected development of future demand. These projections indicate a general decline in the child population across several European markets, particularly in Italy and Spain, reflecting broader demographic trends in Europe. France, however, remains the largest market throughout the forecast period, maintaining a significantly larger child population than the other analyzed countries.

The value for children under 14 in 2030 was not directly available in the source data and was therefore estimated using exponential triple smoothing (Holt–Winters method) based on historical demographic data. This time-series forecasting technique incorporates level, trend, and pattern components of the data, allowing for a more robust projection of future values compared to simple linear extrapolation.

The demographic data used in this analysis was obtained from the World Bank Population Database and UNICEF child population statistics (World Bank, 2024b; UNICEF, 2024).

*Chart 1 Total population under 14*

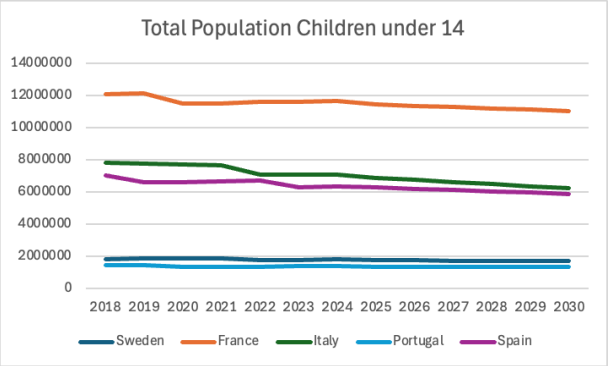

*Chart 2: Birth rates*

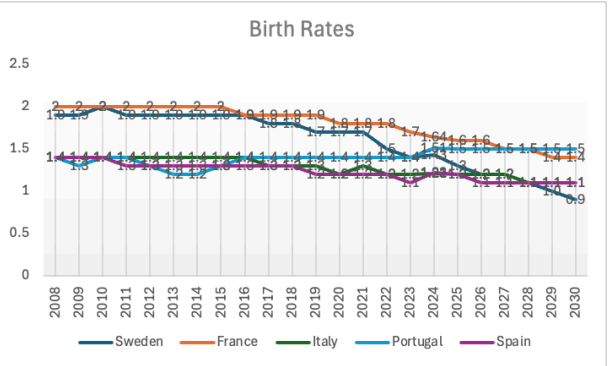

Chart 1 illustrates the development and projected trend of the population of children under the age of 14 in the analyzed markets. The number of children under 14 was calculated by combining total population data from the World Bank population database with the percentage of the population aged 0–14. Specifically, total population figures were multiplied by the share of the population aged 0–14 to estimate the size of this age group in each country (World Bank, 2024a; World Bank, 2024b).

To estimate future values, exponential triple smoothing (Holt-Winters method) was applied to the historical data. This forecasting method accounts for the level and trend in the data and is therefore suitable for projecting demographic developments over time.

The chart shows that France has the largest population of children under 14, indicating a significantly larger potential consumer base for children's products such as stuffed toys. Spain and Italy also represent relatively large markets, while Portugal is considerably smaller.

Chart 2 shows the development of birth rates across the analyzed markets. Birth rates provide an indication of long-term demographic trends affecting future demand. The data shows a general downward trend in most European countries, suggesting that the size of the child population may gradually decline in several markets over time.

Together, these indicators provide insight into both the current size and the future development of the potential customer base for Teddykompaniet's products.

**Weighting of Variables**

Pairwise comparisons were conducted between the main demographic indicators to assess their relative contribution to market demand for children's products.

At the first level, child population ("stock") was considered more important than fertility indicators, since the current size of the child population directly determines the existing consumer base. This resulted in weights of 0.75 for child population variables and 0.25 for birth rate indicators.

Within the child population category, greater importance was assigned to current demographic indicators compared to long-term projections. The resulting weights were:

- Children under 14 (today): 0.356
- Children under 18 (today): 0.119
- Children under 14 (2030): 0.147
- Children under 18 (2030): 0.049
- Children under 14 (2040): 0.060
- Children under 18 (2040): 0.020

Birth rate indicators were included with lower weights due to their indirect impact on short-term demand:

- Historical birth rate: 0.167
- Forecasted birth rate: 0.083

Applying these weights to the normalized demographic indicators produced the following market demand ranking:

1. France
2. Italy
3. Spain
4. Sweden
5. Portugal

France ranks highest due to its significantly larger child population across all demographic indicators, indicating the strongest potential consumer base for Teddykompaniet's products.

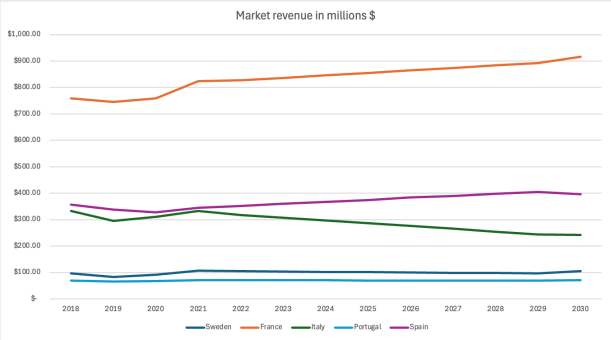

### 3.2.2 Market Size

Market size reflects the overall scale of the stuffed toy market in each country and indicates the potential revenue opportunity for Teddykompaniet. Two indicators were used to assess market size:

- Total market revenue for dolls and stuffed toys
- Revenue per capita in the dolls and stuffed toy segment

Total market revenue captures the overall commercial scale of the market, while revenue per capita reflects the average consumer spending intensity within the product category. Combining these indicators allows the analysis to capture both the absolute market potential and the level of consumer engagement with the product category.

*Chart3 Market revenue in million $*

*Revenue per capita $*

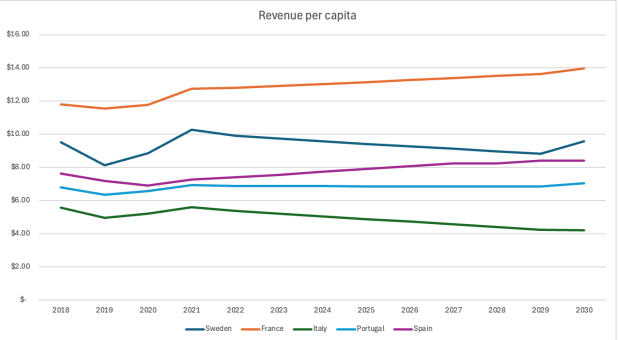

Chart 3 illustrates the development of market revenue in the dolls and stuffed toys segment between 2018 and 2030. France represents the largest market, with revenues significantly higher than in the other analyzed countries and a stable upward trend over time. Spain and Italy form the second tier of markets, with moderate market sizes but different trends. Spain shows gradual growth, while Italy exhibits a declining market trend over the forecast period. Sweden represents a smaller but relatively stable market, while Portugal has the smallest overall market size among the analyzed countries.

The data used for this analysis was obtained from Statista Market Insights, which provides detailed market data and forecasts for the global toys and hobby industry (Statista, 2024).

In the pairwise comparison, greater importance was assigned to total market revenue, as it reflects the overall market opportunity available to a potential entrant. Revenue per capita was assigned a lower weight as it primarily indicates consumer engagement rather than total market scale.

The resulting weights were:

- Total market revenue: 0.75
- Revenue per capita: 0.25

After normalizing the data and applying the weights, the following market size ranking was obtained:

1. France
2. Spain
3. Italy
4. Sweden
5. Portugal

France ranks highest due to its significantly larger market size and higher revenue per capita compared to the other countries, indicating the strongest overall commercial potential for Teddykompaniet's products.

### 3.2.3 Market Growth

Growth indicators were included to evaluate the future development potential of each market. While market size reflects current opportunities, growth indicators provide insight into how the market and the broader economic environment are expected to develop over time. Markets with stronger growth prospects may offer better long-term opportunities even if their current size is smaller.

| market revenue in millions $ | Historical CAGR | Projected CAGR |
|---|---|---|
| Sweden | 0.94% | 0.53% |
| France | 1.82% | 1.35% |
| Italy | -1.92% | -3.32% |
| Portugal | 0.08% | 0.16% |
| Spain | 0.48% | 1.29% |

| market revenue per capita | Historical CAGR | Projected CAGR |
|---|---|---|
| Sweden | 0.12% | 0.02% |
| France | 1.65% | 1.18% |
| Italy | -1.62% | -2.99% |
| Portugal | 0.20% | 0.43% |
| Spain | 0.24% | 1.44% |

| Household disposable income | Historical CAGR | Projected CAGR |
|---|---|---|
| Sweden | 5.74% | 4.65% |
| France | 7.01% | 5.05% |
| Italy | 6.76% | 5.10% |
| Portugal | 8.26% | 5.57% |
| Spain | 7.60% | 5.35% |

| GDP per capita | Historical CAGR | Projected CAGR |
|---|---|---|
| Sweden | 0.93% | 1.30% |
| France | 1.80% | 1.51% |
| Italy | 2.42% | 2.19% |
| Portugal | 3.71% | 3.03% |
| Spain | 2.46% | 2.39% |

| PPP | Historical CAGR | Projected CAGR |
|---|---|---|
| Sweden | 5.16% | 4.16% |
| France | 5.11% | 3.91% |
| Italy | 5.93% | 4.73% |
| Portugal | 6.76% | 5.04% |
| Spain | 6.13% | 4.95% |

To capture both industry-specific development and macroeconomic conditions, two groups of indicators were used: market growth variables and economic growth variables.

The market growth indicators included:

- Market revenue CAGR
- Revenue per capita CAGR

These variables measure how the stuffed toy market itself is expected to develop over time. Market revenue growth reflects the expansion of the overall industry, while revenue per capita growth captures the development of consumer spending intensity within the category.

To account for broader economic conditions affecting purchasing power, three additional macroeconomic indicators were included:

- Household disposable income CAGR
- GDP per capita CAGR
- Purchasing Power Parity (PPP) CAGR

These variables reflect the overall economic environment and the ability of consumers to spend on discretionary products such as toys. Household disposable income represents the direct purchasing capacity of consumers, while GDP per capita and PPP capture broader economic growth and relative price levels across markets.

For each variable, both historical and projected compound annual growth rates (CAGR) were considered. Historical growth reflects past market performance, while projected growth captures expected future developments. Since historical data generally provides a more reliable indication of structural trends, historical values were given a higher weight than projected values. Historical growth was assigned a weight of 0.75, while projected growth received a weight of 0.25.

After combining historical and projected values, the indicators were normalized and aggregated within their respective categories. Within the market growth category, market revenue growth was weighted more heavily than revenue per capita growth, since the total expansion of the industry represents the primary driver of commercial potential. The comparison resulted in weights of 0.75 for market revenue growth and 0.25 for revenue per capita growth.

Within the economic growth category, the three macroeconomic indicators were also weighted using pairwise comparisons. Household disposable income growth received the highest weight (0.63), as it most directly reflects consumer purchasing power. GDP per capita growth received a weight of 0.26, while PPP growth received a weight of 0.11.

Finally, the market growth and economic growth categories were combined to produce a single growth score for each country. Since the development of the stuffed toy market itself is more directly related to the company's potential performance, market growth was weighted at 0.67, while economic growth was weighted at 0.33.

The final results show the following ranking of markets based on growth potential:

1. France
2. Portugal
3. Spain
4. Sweden
5. Italy

France ranks highest due to strong market growth in the stuffed toy segment combined with solid economic development indicators. Portugal and Spain also perform well due to favorable economic growth prospects and positive market development trends. Sweden shows moderate growth potential but weaker economic growth compared with the leading markets. Italy ranks lowest due to negative market growth indicators within the stuffed toy segment.

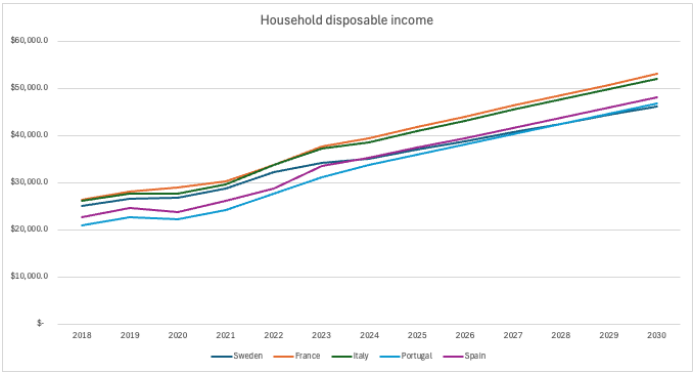

Market revenue and revenue per capita data were obtained from Statista Market Insights, while macroeconomic indicators were sourced from the OECD Household Disposable Income database and the World Bank economic indicators database (Statista, 2024; OECD, 2024; World Bank, 2024a; World Bank, 2024b). Forecasts were generated using exponential smoothing based on historical trends.

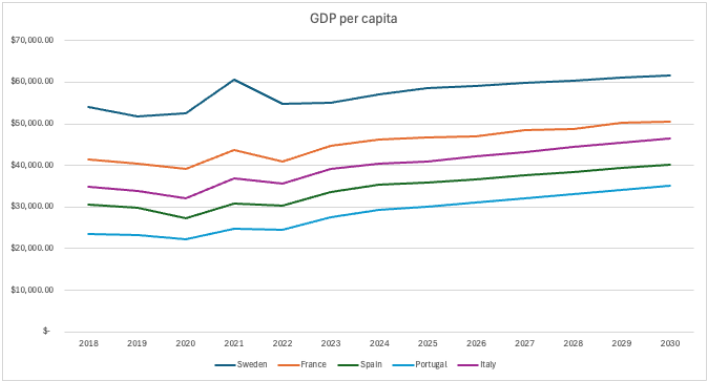

### 3.2.4 Purchasing Power

Purchasing power is particularly important for Teddykompaniet because the company operates in the premium segment of stuffed toys. Consumers must therefore have sufficient disposable income to purchase higher-priced products. Markets with stronger purchasing power are more attractive because they indicate a greater ability and willingness to spend on premium toys.

To capture the purchasing capacity of consumers, three economic indicators were included:

- Household disposable income
- GDP per capita
- Purchasing Power Parity (PPP)

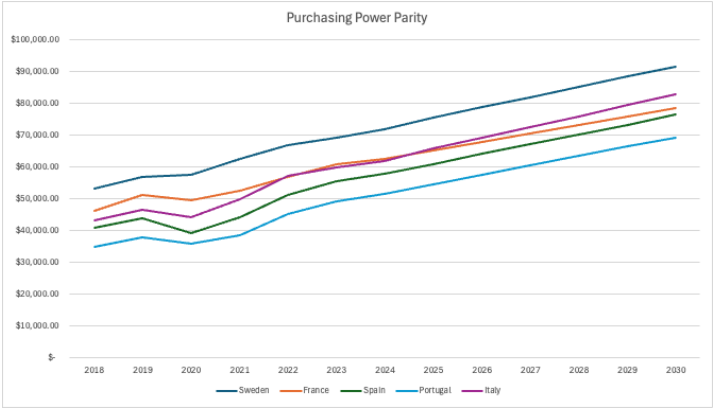

These indicators capture both income levels and relative price levels across markets. Household disposable income reflects the amount of income available for household consumption after taxes and transfers. GDP per capita provides an indicator of overall economic prosperity, while PPP captures differences in price levels and real purchasing power between countries.

The data shows a consistent upward trend across all countries for each indicator between 2018 and the forecast period up to 2030. As illustrated in the charts, France and Italy display relatively high income levels throughout the period, while Sweden consistently maintains the highest GDP per capita and PPP levels. Portugal shows lower absolute income levels but demonstrates steady growth over time. Spain generally performs between the higher-income markets and Portugal.

The forecasts displayed in the charts were generated using exponential smoothing, which extends historical trends to estimate future development. This method allows for a smoothed projection of economic indicators while reducing the influence of short-term fluctuations.

Data for household disposable income was obtained from the OECD Household Disposable Income Statistics (OECD, 2024). GDP per capita and purchasing power parity data were sourced from the World Bank

economic indicators database (World Bank, 2024c; World Bank, 2024d).

The pairwise comparison matrix reflects the assumption that disposable income is the most relevant indicator for premium consumer goods, followed by GDP per capita and PPP. The resulting weights were:

- Disposable household income: 0.63
- GDP per capita: 0.26
- Purchasing Power Parity (PPP): 0.11

These weights were applied to normalized country scores for each indicator in order to calculate a single purchasing power index for each market.

The final results show the following ranking of markets based on purchasing power:

1. France
2. Italy
3. Sweden
4. Spain
5. Portugal

France ranks highest due to strong performance across all three indicators, indicating high consumer purchasing capacity. Italy also shows strong income levels and purchasing power, while Sweden ranks third due to high GDP per capita but slightly lower disposable income compared to France. Spain demonstrates moderate purchasing power, while Portugal ranks lowest due to comparatively lower income levels despite steady growth.

### 3.2.5 Market Conditions

Market conditions influence how easily Teddykompaniet can enter and operate in a foreign market. In particular, the company's distribution model and the level of competition in the stuffed toy market can significantly affect market accessibility and potential success.

Two indicators were therefore included in the analysis:

- Share of in-store purchases
- Market competition and fragmentation

The first variable captures the importance of physical retail channels, while the second variable reflects the level of competition from existing brands.

**Sales Channels**

For Teddykompaniet, physical retail channels are particularly important because stuffed toys are frequently purchased as impulse or gift products in physical stores, such as toy stores, department stores, and gift shops. A higher share of in-store purchases therefore indicates a more favorable distribution environment.

The chart illustrates the share of in-store purchases in the dolls and stuffed toys segment between 2018 and 2029. Italy consistently shows the highest level of in-store purchasing, remaining close to 100% throughout the period. Although the data for Italy was obtained from a reputable source, the reported values close to 100% in-store purchases appear unusually high and may reflect differences in how sales channels are reported. Due to this potential inconsistency, the sales channel variable was weighted conservatively in the analysis to reduce the risk of bias in the results. Sweden, Portugal, and Spain also

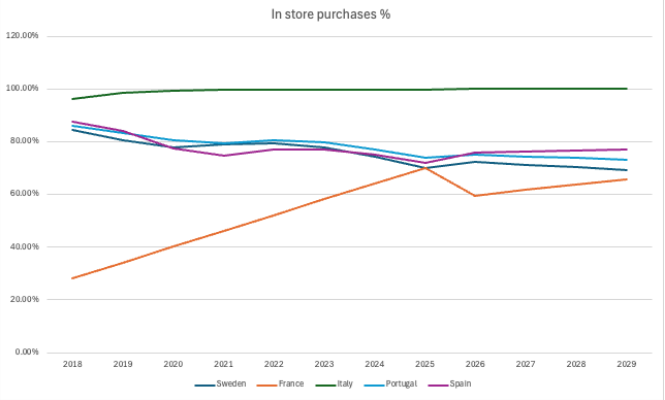

| In store purchase | trend |
|---|---|
| Sweden | -1.29% |
| France | 3.34% |
| Italy | 0.22% |
| Portugal | -1.09% |
| Spain | -0.69% |

maintain relatively high levels of physical retail sales, although these markets show a gradual decline over time as online sales increase. France differs from the other markets, with a significantly lower initial share of in-store purchases but a strong upward trend over time.

Both the current level of in-store purchases and the trend over time were included in the analysis. The level of in-store purchasing was considered more important than the trend, since the current distribution structure is more directly relevant for market entry. The pairwise comparison resulted in weights of:

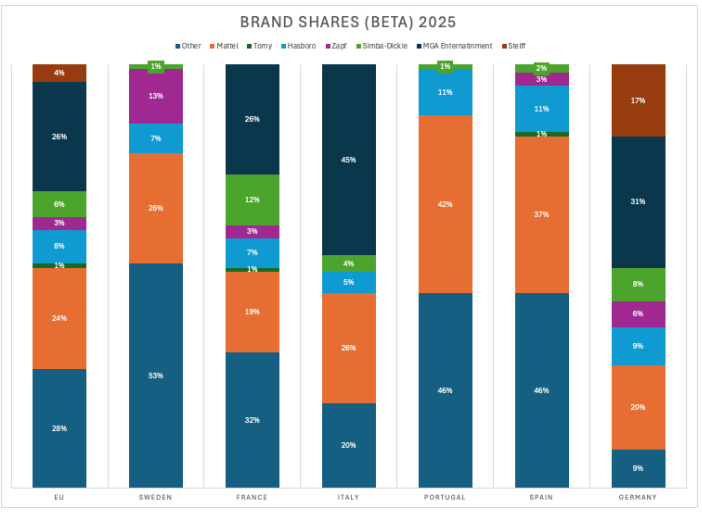

- Level of in-store purchases: 0.67
- Trend in in-store purchases: 0.33

After normalization and weighting, Italy received the highest score due to its extremely strong physical retail presence, followed by France, Sweden, Portugal, and Spain. Data for sales channels was obtained from Statista Market Insights for the Dolls and Stuffed Toys segment (Statista, 2024).

**Market Competition**

Competition within the stuffed toy market was measured using brand market share data. The analysis focused on the share of the category labelled "Other", which represents smaller brands and fragmented market participants. A higher share of "Other" indicates a more fragmented market structure with fewer

dominant competitors, making it easier for new entrants such as Teddykompaniet to gain market share. This reflects a more fragmented competitive structure, which, from a Porter's Five Forces perspective, indicates the absence of dominant players and may create opportunities for new entrants to establish a position in the market (Porter, 1980).

The brand share chart shows that Sweden has the highest share of "Other" brands, indicating a highly fragmented market. Portugal and Spain also display relatively high fragmentation levels. In contrast, Italy has a much more concentrated market structure dominated by a few major brands, suggesting stronger competitive pressure.

Brand share data was obtained from Statista Market Insights for the dolls and stuffed toys segment (Statista, 2024).

Weighting and Combined Results

To combine the two indicators, a final AHP comparison was performed between sales channels and market competition. Due to the potential uncertainty in the reported sales channel data for Italy, greater emphasis was placed on the competition variable in order to reduce the risk of bias in the results. As a result:

- Sales channels: 0.25
- Competition/fragmentation: 0.75

The weighted results produced the following overall ranking for market conditions:

1. Sweden
2. Portugal
3. Spain
4. France
5. Italy

### 3.2.6 Business Environment and Entry Feasibility

Finally, variables related to the institutional environment and strategic fit were included in the analysis. These indicators evaluate how favorable each market is for Swedish firms and how easily Teddykompaniet could establish a competitive position.

Five indicators were used:

- Perception of Swedish brands as beneficial, measures how positively Swedish companies view the value of "Brand Sweden" in the market. A higher score suggests Swedish origin is seen as an advantage.
- Positive business climate, shows how Swedish firms evaluate the overall business environment in the specific country. A higher value indicates more favorable operating conditions.

- Investment plans within the next 12 months, represents the share of Swedish firms that plans to increase their investment in the nearer future. High values shows stronger that the firms are optimistic in the specific country.
- Expected industry turnover growth, measures how many Swedish firms in the specific country that expect their industry sales to grow, which shows in which direction the market is developing.
- Business climate trend over the past five years, is an indicator that measures the average development of the "positive business climate" over the last five years and shows the trend of the business climate.

These variables capture both general business environment conditions and market dynamism, which are important for evaluating the feasibility of entering and operating in a foreign market. In line with the Uppsala model, favorable institutional conditions and positive perceptions of Swedish firms can reduce the liability of foreignness and support initial market entry (Johanson & Vahlne, 1977).

| Countries | Brand Sweden perceived as beneficial (% | Positive business climate (%) | Investment plans (%)(12Months) | Expected industry turnover growth (%) | Business climate – 5-year trend (%) |
|---|---|---|---|---|---|
| France | 75% | 59% | 26% | 61% | 63% |
| Italy | 87% | 77% | 33% | 59% | 74% |
| Portugal | 71% | 41% | 51% | 73% | 56% |
| Spain | 88% | 47% | 48% | 72% | 69% |
| Germany | 80% | 52% | 35% | 60% | 54% |

First, the indicators were grouped into two broader categories: business environment and market dynamism.

The business environment category included:

- Positive business climate
- Business climate trend (5-year trend)

Since the current business climate provides the most direct indication of operating conditions, it was given a higher weight. The resulting weights were:

- Positive business climate: 0.67

- Business climate trend: 0.33

The market dynamism category included:

- Perception of Swedish brands as beneficial
- Investment plans (next 12 months)
- Expected industry turnover growth

These indicators capture how receptive the market is to Swedish companies and how strongly the industry is expected to grow. Using pairwise comparisons, the resulting weights were:

- Expected industry turnover growth: 0.54
- Investment plans: 0.26
- Perception of Swedish brands as beneficial: 0.11

Finally, the business environment and market dynamism categories were combined, with business environment weighted at 0.67 and market dynamism at 0.33, reflecting the importance of stable institutional conditions for market entry.

After applying the weights and normalizing the data, the final ranking for market conditions and entry feasibility is:

1. Italy
2. Spain
3. France
4. Portugal

Italy ranks highest due to a highly favorable business climate and strong perception of Swedish brands. Spain also performs well due to strong industry growth expectations and investment plans. France shows moderate results across most indicators, while Portugal ranks lowest despite strong investment expectations, due to weaker overall business climate indicators.

The data was obtained from the Business Sweden Business Climate Survey, which measures the perceptions and expectations of Swedish companies operating in foreign markets. For the business climate variable, five-year averages were calculated using Business Sweden's country-specific Business Climate Surveys from 2021–2025 (Business Sweden, 2025).

## 3.3 Final Market Comparison and Selection

After evaluating each market across the different dimensions, the results from the individual analyses were aggregated to determine the overall attractiveness of each market. The analysis included six categories: market demand, purchasing power, market conditions, market growth, market size, and

entry feasibility. Each category captures a different aspect of market attractiveness and the potential competitive position of Teddykompaniet.

To combine these categories, the Analytic Hierarchy Process (AHP), was used to assign relative weights based on their importance for Teddykompaniet's international expansion. Market size was considered the most important factor, as it reflects the overall revenue potential of the market. Market conditions and entry feasibility were also given relatively high importance, as they determine how easily the company can enter and compete in the market. Purchasing power and market growth capture longer-term demand potential, while market demand indicators reflect demographic development within the target segment.

The final weights assigned to the categories were:

- Market demand: 0.10
- Purchasing Power: 0.15
- Market conditions: 0.20
- Market growth: 0.15
- Market size: 0.25
- Business Environment & Entry feasibility: 0.15

The weighted scores from each category were then aggregated to produce an overall market attractiveness score for each country.

1. France
2. Spain
3. Italy
4. Portugal

The results indicate that France is the most attractive market for Teddykompaniet. France performs strongly across several categories, particularly in market size and purchasing power, which together indicate a large and economically strong consumer base for premium stuffed toys. The market also shows solid growth indicators and a relatively favorable business environment.

Spain ranks second, primarily due to strong results in market conditions and growth indicators. While the overall market size is smaller than in France, the market shows good long-term potential and favorable entry conditions.

Italy ranks third. Although Italy performs well in market conditions and entry feasibility, the market shows weaker results in growth indicators and overall demand potential compared with France and Spain.

Finally, Portugal ranks fourth. Despite positive economic growth indicators, the market is significantly smaller and shows lower purchasing power levels compared with the other countries, which reduces its overall attractiveness for Teddykompaniet.

Overall, the analysis suggests that France represents the most attractive market for expansion, as it combines a large market size, strong purchasing power, and favorable growth conditions. Spain also presents promising opportunities, particularly in economically strong regions such as Catalonia and Madrid. Similarly, while Italy ranks lower overall, northern Italy stands out as a more attractive sub-market due to its higher income levels, stronger economic activity, and geographical proximity to France, which may facilitate expansion and distribution.

# 4 Entry Mode

## 4.1 Entry Mode Alternatives

When entering a foreign market, firms must choose an entry mode that balances control, investment requirements, and operational complexity. The choice of entry mode should therefore reflect both the firm's internal capabilities and the characteristics of the target market. For Teddykompaniet, the most relevant entry modes are distributor-based exporting, direct retail partnerships, and a wholly owned subsidiary. These alternatives differ significantly in terms of resource commitment and managerial requirements.

### 4.1.1 Distributor-Based Export

The most direct continuation of Teddykompaniet's current business model is exporting products through a local distributor. In this model, the distributor is responsible for importing products, managing local logistics, and selling to retailers within the target market.

This approach aligns closely with the company's existing international operations. Teddykompaniet already relies on retailers, agents, and distributors to reach consumers rather than operating its own retail stores. The company has also developed experience managing reseller relationships in nearby export markets such as Norway and Denmark. This suggests that the organizational routines and capabilities required for distributor-based expansion are already established.

The main advantage of this entry mode is the relatively low financial and operational commitment. The distributor provides local market knowledge, established relationships with retailers, and existing distribution infrastructure. This reduces both the complexity and risk associated with entering a new market. However, the model also implies reduced control over how the brand is represented in the market. (Lindner & Puck , 2025).

Because Teddykompaniet's competitive advantage is strongly linked to brand identity and emotional positioning, inappropriate retail placement or aggressive discounting by a distributor could weaken the brand's differentiation.

### 4.1.2 Direct Partnerships with Retailers

A second potential entry mode involves selling directly to large retailers or retail chains within the target market without relying on a distributor.

This approach could increase the company's control over product placement and retail positioning. Direct relationships with key retailers may also strengthen brand visibility and allow Teddykompaniet to maintain greater influence over pricing and assortment decisions.

However, this strategy would require the company to manage multiple retailer relationships simultaneously, which increases operational complexity (Lindner & Puck , 2025).

The firm would need stronger internal sales capabilities, greater coordination with retailers, and more advanced logistics management.

Given the company's relatively lean organizational structure and centralized distribution system, managing a large number of direct retail relationships in a new market could place significant pressure on internal resources.

### 4.1.3 Wholly Owned Subsidiary

The third possible entry mode is the establishment of a local subsidiary, potentially including local sales teams, marketing activities, and distribution operations.

This strategy would provide the highest level of control over brand positioning, pricing, and retail strategy. It would also allow Teddykompaniet to build a stronger long-term presence in the market.

However, this option also requires the highest level of financial investment and managerial commitment. Establishing a subsidiary involves significant setup costs, operational risk, and ongoing management responsibilities. (Lindner & Puck , 2025)

Considering Teddykompaniet's relatively small expansion budget and lean organizational structure, this entry mode would represent a substantial increase in both financial exposure and organizational complexity.

## 4.2 Recommended Entry Mode

Based on the analysis above, the most appropriate entry mode for Teddykompaniet is exporting through a carefully selected local distributor.

This approach aligns closely with the company's existing business model and organizational capabilities. Teddykompaniet already operates with a retail- and distributor-oriented sales structure, meaning that the company's internal processes are designed to support this type of market access. Expanding through distributors therefore represents a natural extension of the firm's current operations.

From the perspective of the OLI framework (Dunning, 1979), the company possesses strong ownership advantages in the form of brand identity, product quality, and the positive reputation

associated with Swedish design and safety standards. However, the firm has limited incentives to fully internalize foreign operations due to its relatively small scale and limited expansion budget. Partnering with a distributor therefore allows the company to leverage its brand advantages while avoiding the financial and organizational burden associated with establishing local subsidiaries.

The recommended approach is also consistent with the Uppsala model (Johanson & Vahlne, 1977) of internationalization, which suggests that firms typically expand gradually as they accumulate market knowledge and international experience. Entering a new market through a distributor enables Teddykompaniet to gain insight into local consumer preferences, retail structures, and competitive dynamics before committing additional resources.

Operationally, this entry mode also fits the company's centralized logistics structure, where products are distributed from a single warehouse in Sweden. Exporting to a distributor allows the firm to maintain its existing logistics configuration while still expanding geographically.

## 4.3 Characteristics of the Recommended Entry mode

Under the recommended strategy, Teddykompaniet would enter the French market through a local distributor specializing in children's toys. This entry model allows the company to leverage the distributor's established retail relationships, logistical infrastructure, and knowledge of the market, thus reducing the liability of foreignness as described in the revised Uppsala model.

The distributor would typically perform several operational functions within the domestic market, including:

- Importing product from Sweden
- Managing local warehousing and logistics
- Selling to retailers, toy stores, and specialty boutiques
- Maintaining relationships with retail chains and buying groups

This structure significantly reduces the operational complexity for Tedyykompaniet while enabling the company to access established retail networks in France.

Teddykomapniet would retain responsibility for product development, brand communication, and overall strategic positioning. Rather than pursuing rapid nationwide distribution immediately, Teddykompaniet should initially focus on selected retail partners that align with the brand's positioning, such as premium toy stores, baby boutiques, and curated children's retailers. Examples of such retailers in the French market include Natalys and Smallable, which target design-conscious parents and gift buyers seeking high-quality children's products.

This targeted distribution approach allows Teddykompaniet to gradually build brand recognition, credibility, and trust among consumers before expanding into broader retail channels.

The recommended entry mode therefore follows a gradual market development approach. By first establishing the brand through selected distributors and retailers, Teddykompaniet can gain insight into local consumer behavior, retail structures, and competitive dynamics before increasing its level of market commitment. Over time, successful cooperation with distributors and retailers may enable the company to expand distribution, increase brand visibility, and strengthen its position within the French market.

While this entry structure offers advantages in terms of operational feasibility and risk reduction, its success ultimately depends on several strategic and operational conditions. These factors are discussed in the following section.

## 4.4 Critical Success Factors

### 4.4.1 Distributor Selection

Since Teddykompaniet's competitive advantage relies strongly on its brand identity, distributor selection represents the most critical success factor for the recommended entry strategy. Because the distributor will manage local sales, logistics, and retailer relationships, this entry mode inevitably reduces the company's direct control over how the brand is presented in the market. Consequently, the selected distributor must demonstrate a strong alignment with Teddykompaniet's positioning around quality, safety, and emotional value.

The analysis of the French distributor landscape indicates that potential partners differ significantly in terms of scale, distribution strategy, and brand orientation. One potential partner is DAM, a medium-sized distributor specializing in premium and educational toys. DAM focuses on brands that emphasize quality, sustainability, storytelling, and design, which aligns closely with Teddykompaniet's brand identity (DAM, 2026). Its portfolio already includes plush toys and lifestyle products for children, suggesting that Teddykompaniet's products could be integrated relatively easily into its existing distribution channels. In addition, DAM's medium size may allow for closer collaboration and stronger attention to individual brands compared to larger distributors. However, its smaller scale may limit the speed of nationwide expansion compared with larger distribution partners.

In contrast, WDK Groupe represents a large-scale toy distributor with extensive logistics infrastructure and access to major retail chains across France. With a portfolio of more than 10,000 products and distribution to supermarkets, toy stores, and e-commerce platforms, WDK could provide rapid access to a wide retail network (WDK Groupe, 2026). However, the company's focus on

high-volume products and private labels may create risks for Teddykompaniet's premium positioning, as smaller premium brands may receive less strategic attention in a large mass-market portfolio.

A third potential partner is B&G International, a smaller distributor specializing in toy import and distribution to retailers and buying groups. B&G may offer flexibility and closer cooperation due to its smaller scale and focus on sourcing new toy products (B&G International, 2026). However, its more limited logistics capacity and lower brand recognition may constrain expansion at a national level.

Overall, the analysis suggests that distributor selection should prioritize strategic alignment and brand positioning rather than maximum distribution reach. A distributor with a strong focus on premium toy brands, such as DAM, is therefore likely to provide a better strategic fit than larger mass-oriented distributors in the early stages of market entry.

### 4.4.2 Brand Positioning

Consumer preferences in the French toy market have important implications for Teddykompaniet's entry strategy and the type of distribution partners the company should work with.

Research on the French toy market shows that product features, quality, and safety are among the most important factors influencing toy purchases, and many parents report rejecting toys due to concerns related to product characteristics or safety standards (Taiwan Institute of Economic Research [TIER], 2017). In addition, brand reputation plays an important role in the decision-making process, with approximately 75% of parents considering brand important when purchasing toys.

The report also highlights the continued importance of physical retail environments in the purchasing process. Approximately 41% of consumers visit physical stores to obtain information and learn more about toys before making a purchase (IDB & TIER, 2017).

This indicates that retail stores do not only function as sales channels but also as places where parents evaluate product quality, materials, and brand credibility.

Because consumers rely on physical retail environments to evaluate toys, the way products are presented in stores becomes highly important for brand perception. When a company enters a market through a distributor, the distributor plays a key role in determining which retailers carry the products and how they are positioned within those retail environments.

For Teddykompaniet, whose competitive advantage relies strongly on brand identity and perceived product quality, it is therefore essential that distributors prioritize retail channels that reinforce the brand's premium positioning. Placement in curated toy stores, baby boutiques, or premium children's retailers can support the brand's emphasis on quality and safety. In contrast, distribution through highly price-driven retail environments may weaken brand perception and reduce differentiation from mass-market competitors.

Consequently, the importance of brand reputation and the role of physical retail environments in the French toy market further supports the strategy of entering the market through carefully selected

distributors and retail partners rather than pursuing rapid expansion through large-scale mass retail channels.

### 4.4.3 Retail Environment

The retail environment in France has important implications for Teddykompnaiet's recommended entry mode. Since the proposed strategy relies on a distributor combined with selected retail partnerships, the fit between the brand and the retail channels becomes an important success factor.

Based on our views of selected French toy retailers and premium children's stores, two broad retail environments appear particularly relevant. On the one hand, there are large toy chains such as King Jouet and JouéClub, which offer broad assortments of toys from many international brands (King Jouet, 2026. ; JouéClub, 2026.). On the other hand, there are more curated retailers such as Natalys and Smallable, which focus primarily on premium and quality brands (Smallable, 2026.; Natalys, 2026).

Our review of company websites also suggests that some brands are distributed more broadly than others across the French market. Larger multinational toy companies such as MGA Entertainment and Mattel appear frequently in large toy retail chains such as King Jouet and JouéClub (King Jouet, 2026. ; JouéClub, 2026.). These retailers typically offer broad assortments of toys and include globally recognized brands and licensed products. In contrast, brands such as Bukowski, Doudou et Compagnie, and appear more often in specialty toy stores, gift shops, and other curated retail environments (Bukowski, 2026; Doudou et Compagnie, 2026). Based on this mapping of retail channels, it appears that companies competing
primarily through brand identity, design, and product quality tend to rely more heavily on specialized retailers rather than large mass-market toy chains.

This observation has implications for Teddykompaniet's entry strategy. If the products are introduced through highly price-driven retail environments from the beginning, there is risk that the brand may be perceived as competing on the same terms as the mass-market toy brands. By contrast, placement in retailers such as Natalys and Smallable may better support the company's desired positioning, as these retailers appear to reflect similar brand values as Teddykompaniet.

At the same time, broader retail chains should not necessarily be excluded in the long term. Their large store networks may become relevant once the brand is more established in the market. However, based on the retail mapping conducted for this report, they appear better suited as later-stage expansion channels rather than initial points of entry.

Overall, the retail environment supports the recommendation that Teddykompaniet should enter France through a distributor capable of accessing premium retail channels, while initially prioritizing retail partners that reinforce the brand's positioning rather than maximizing short-term distribution reach.

### 4.4.4 Supply Chain Reliability

Supply chain reliability represents another critical factor for the success of Teddykompnaiet's entry strategy. The company currently operates with a centralized logistics structure in Sweden, meaning that products must be transported internationally to reach foreign retailers. As a result, the structure of the distribution channels directly affects transportation costs, delivery efficiency, and operational complexity.

Under a distributor-based entry model, products can be shipped in larger consolidated shipments from Sweden to a single distributor warehouse in the target market. The distributor then manages local warehousing and distribution to individual retailers. This structure can reduce logistical complexity compared with selling directly to a large number of retailers abroad. Instead of coordinating multiple smaller shipments to individual stores, Teddykompaniet would primarily manage shipments to a limited number of distribution partners.

Larger palletized shipments or container loads are more cost efficient than smaller parcels. Bulk shipments reduce cost per unit transported and allow freight forwarders to operate more efficiently through consolidated transport routes. In contrast, supplying many individual retailers directly would require frequent smaller shipments, which increases transportation costs, administrative coordination, and the risk of delivery delays (Sendify, 2026).

In addition to cost considerations, a distributor can also provide local warehousing and inventory management, which improves delivery reliability for retailers. By holding inventory closer to the market, distributors can respond more quickly to retailer orders and reduce lead times compared with direct international shipments from Sweden.

## 4.5 Final Recommendation

Overall, entering France through a premium-oriented distributor such as DAM combined with selected retail partners like Smallable and natalys provides a balanced strategy that supports brand positioning, operational feasibility, and controlled international growth.

The analysis indicates that the most suitable entry strategy for Teddykompaniet is to enter the French market through a premium-oriented distributor combined with selective retail partnerships. This approach aligns with the company's existing business model, centralized logistics structure, and brand positioning around quality, safety, and emotional value.

Among the distributors analyzed, DAM represents the strongest strategic fit, given its focus on premium products and alignment with Teddykompaniet's positioning. Partnering with DAM enables access to established retail networks while maintaining appropriate brand presentation.
At the retail level, the initial focus should be on curated and premium children's retailers such as Smallable and Natalys, which better reflect the brand's positioning than price-driven mass-market chains.

From a logistics perspective, distributor-based entry improves efficiency by enabling consolidated shipments to a single warehouse, reducing complexity and improving responsiveness compared to direct distribution.

The strategy follows a gradual market approach, where Teddykompaniet first builds brand recognition through premium channels before expanding into larger retail chains such as King Jouet or JouéClub. In the longer term, this model can also support expansion into regions such as Northern Italy and key Spanish markets.

Overall, a distributor-led entry through DAM combined with selected retail partners provides a balanced strategy that supports brand positioning, operational efficiency, and controlled international growth.

# 5. Global Marketing Plan

## 5.1 Breaking Down the International Marketing Strategy

### 5.1.1 Product

Teddykompaniet's product strategy in France should remain closely aligned with its core identity of safety, quality, and storytelling. The company's value proposition is largely transferable, as the French market responds to similar drivers such as trust, softness, quality, and sustainability (IDB & TIER, 2017). Rather than redesigning the product, adjustments should focus on French-language packaging, clear communication of safety and quality standards, and strong product storytelling to maintain

emotional appeal. Initially, the company should prioritize its strongest and most premium product lines rather than the full range, reducing risk while reinforcing brand positioning.

### 5.1.2 Price

Teddykompaniet should retain its current pricing strategy and avoid competing on price, as this would weaken its premium positioning. Instead, pricing should signal quality, trust, and emotional value. The French market supports this approach, as evidenced by premium retailers like Smallable and Natalys. To align with these retailers, it should match that of Smallable (€25–€75) and Natalys (€15–€140) (Smallable, 2026; Natalys, 2026). Prices should remain premium enough to protect brand value, competitive within the segment, and stable to avoid excessive discounting. Establishing recommended retail prices is also important to prevent price erosion or overpricing that could harm brand perception.

### 5.1.3 Place

The distribution strategy should be selective and align with Teddykompaniet's premium positioning. Instead of immediate large-scale distribution, Teddykompaniet should initially focus on carefully chosen retail environments that reflect its values of quality, safety, and emotional storytelling. Natalys and Smallable are French market retailers where customers are more likely to value product quality and emotional appeal rather than price. The distributor should also be selected not only on reach but on access to these curated retail channels. At first, price-driven retail chains should be avoided to protect brand perception; broader distribution can be considered later, once the brand is more established.

### 5.1.4 People

People play a central role in communicating Teddykompaniet's brand value, particularly in physical retail environments where store staff influence customer perception. It is therefore essential that both distributors and retail partners understand and communicate the brand's core values of safety, quality, and emotional attachment. Staff should be able to clearly explain what differentiates Teddykompaniet from mass-market brands, especially in terms of materials, design, and storytelling. In addition, having French-speaking employees or local representatives can improve communication, relationship-building, and overall market entry by reducing misunderstandings.

### 5.1.5 Promotion

Teddykompaniet's promotion strategy should emphasize emotional storytelling alongside digital advertising. Products should be positioned not only as toys, but as meaningful companions and premium quality gifts for young children. Collaborations with parenting influencers, lifestyle creators,

and additional Google Ads campaigns can strengthen this positioning and increase visibility among the target audience.

### 5.1.6 Process

The process behind product delivery and availability is essential for maintaining trust and consistency. Teddykompaniet's should maintain its centralized logistics structure during the initial expansion phase, with a local distributor managing import, storage, and distribution in the French market. The distributor will play a key role in inventory management and ensuring consistent product availability across selected retailers. A reliable and well-coordinated process is particularly important for premium products, as delays or stock issues can negatively impact both customer experience and brand perception.

### 5.1.7 Physical Evidence

Physical evidence is essential in reinforcing Teddykompaniet's premium brand image. As plush toys are tactile and emotional products, customers rely on visual and sensory cues to assess quality. Packaging, presentation, and in-store displays should reflect a clean Scandinavian aesthetic, using soft colors, natural materials, and simple design to communicate safety and trust. Product placement is also important. Positioning items in curated sections, gift areas, or premium shelves can enhance perceived value and differentiate the brand from mass-market competitors.

## 5.2 French Market Main Actors

### 5.2.1 Main Actors

Key market actors in the French plush toy market include Mattel, Tomy, Hasbro, Smoby, Simba-Dickie, and MGA Entertainment. These players account for approximately 68% of the market, while smaller brands represent the remaining 32% (Statista, 2024). Large retailers such as King Jouet and JouéClub offer broad assortments of plush toys. However, to maintain its premium positioning, Teddykompaniet should prioritize retailers which focus on quality-oriented products and align more closely with the brand's identity.

### 5.2.2 Location

Key actors are concentrated in major urban retail areas across France, with Paris and Southeastern regions representing the most attractive entry points due to higher demand and income levels (Statista). Paris stands out as the primary target market, with high disposable income ($329,774.71) and dense population, making it the most attractive location for initial expansion (Geo-Ref.net, 2025; Eurostat, 2024). Once established, expansion into regions such as Provence-Alpes-Côte d'Azur, which

also combines relatively high income levels ($120,282.87) with a large population, is recommended (Geo-Ref.net, 2025; Eurostat, 2024). These regions are further supported by the presence of key retailers such as Smallable, Natalys, King Jouet, and JouéClub, strengthening their attractiveness for market entry.

### 5.2.3 Relationships and Insidership

Teddykompaniet should build relationships in the French market through trusted distributors that can connect the brand with retailers aligned with its positioning. To strengthen market insight, the company should also engage local experts to conduct surveys and monitor key performance indicators, including public perception (target ≅80% positive), sales growth (≈0.06% market share), reduced product returns, and increased digital sales (from 5% to 20%).

## 5.3 Barriers To Entry

### 5.3.1 Liability of Foreignness

Liability of foreignness is a key challenge when entering unfamiliar markets (Johanson & Vahlne, 1977). Teddykompaniet lacks the same market knowledge as established French brands, and consumer preferences cannot be fully captured through data alone (Business Sweden, 2025). The French market already includes strong domestic players such as Doudou et Compagnie, Histoire d'Ours, and Moulin Roty, which benefit from local experience and consumer understanding. As a foreign brand, Teddykompaniet may therefore face initial resistance. However, the success of brands like Jellycat and Bukowski shows that entry is possible. To reduce this liability, Teddykompaniet should invest in local expertise to better understand the market and align its strategy with French consumer preferences.

### 5.3.2 Competition

The French plush toy market is highly competitive, with major brands controlling approximately 68% of the market, leaving only 32% to smaller players (Statista, 2024). As a new entrant, Teddykompaniet may face challenges gaining market share and visibility because of the established competitors with larger budgets. Thus, Teddykompaniet should rely on a strong distributor with locally adapted marketing to secure placement in suitable retail environments. Larger competitors benefit from better shelf placement and visibility, while Teddykompaniet must instead leverage its brand reputation to drive sales.

### 5.3.3 Dependence on External Actors

Teddykompaniet's reliance on distributors reduces control over product perception, placement, and pricing in the market. This makes partner selection critical. Teddykompaniet must use a reliable distributor with a strong reputation in the French market, ensuring beneficial product positioning and avoiding negative brand impact from poor placement or inconsistent pricing.

### 5.3.4 Financing

Teddykompaniet's relatively limited budget may act as a barrier to entry. While the company has allocated 5 million SEK for expansion, if this budget is exceeded, it could delay or prevent market entry unless additional funding is secured.

## 5.4 Marketing Strategy Recommendation

### 5.4.1 Communication Strategy

Teddykompaniet's communication in the French market should emphasize its core values of safety, quality, sustainability, and emotional storytelling. These values are transferable and should be consistently highlighted across digital channels, including Google Ads and social media. The brand should also leverage its Swedish origin, as Sweden is globally associated with innovation, quality, and responsible production, which can strengthen consumer trust (Business Sweden, 2025).

### 5.4.2 Digital Strategy

The French market shows strong digital engagement, with approximately 60% of purchases occurring online (Statista, 2024). To capture this demand, Teddykompaniet must strengthen its digital presence, increasing online sales from around 5% to a target of 20%. Currently, the brand lacks visibility in search results for key French terms such as peluche, doudou, and nounours. Since the top five Google results capture around 70% of clicks (Advanced Metrics, 2014), improving SEO and using relevant French keywords in product descriptions and ads is essential. Increased investment in Google Ads can further enhance visibility and drive traffic to Teddykompaniet's website.

### 5.4.3 Market Capture

The French plush toy and dolls market generated an average of $806.29 million annually between 2018–2025 and is projected to reach $886.15 million for 2026–2030 (Statista, 2024). To break even on an initial investment of 5 million SEK (≈$535,102.74) within four years, Teddykompaniet would need to capture approximately 0.0604% of the French market. This level of market share would allow the company to recover its initial investment.

### 5.4.4 Activation Strategy

Given Teddykompaniet's limited expansion budget, market entry should be executed through a local distributor. The distributor can support seasonal gifting campaigns, retailer training, in-store placement, and product visibility, while helping maintain the brand's premium positioning.

### 5.4.5 Use of French-Speaking Employees

Teddykompaniet already has some internal French language capability, which is an advantage. However, the company should also hire local experts with strong knowledge of the French market and advertising preferences. These employees can support distributor management, negotiations with premium retailers, brand adaptation to local preferences, and market feedback. This should be implemented early in the internationalization process to ensure trust, alignment, and effective market entry.

### 5.4.6 Target Market

The primary target segments are parents of young children and gift buyers seeking long-term, high-quality products. Geographically, the focus should be on high-income regions in Northern and Southeastern France, with Paris as the initial entry point.

## 5.5 Conclusion

Teddykompaniet should enter France through a phased distributor-based strategy, choosing to align with a distributor that follows Teddykompaniets core values. The first retail focus should be on curated premium French channels such as Natalys and Smallable, where the brand's quality, safety, and emotional storytelling value are integral parts of the plush products at those stores. Teddykompaniet should not rush into implementing a mass scale integration of its products in the french market and should instead work in phases towards selling products in the french market, starting with the most popular products or products that align well with French market demand. Hiring employees who are experts with the french market will also help to a smooth integration. Overall, Teddykompaniet should enter France carefully, and protect the premium brand.
